

ADT Projekt is now ADT Project Consulting

Extended consulting expertise in international cooperation

Over 20 years of experience in international technical cooperation and project implementation. The new name *ADT Project Consulting GmbH* stands for both the position we have reached today and our future orientation as a consulting company in the agricultural and food sector. "ADT" means expertise, reliability and well-established networks including farmer associations, specialist institutions and service providers in the sector. Our shareholders are six national umbrella organizations of German animal production, which are supporting us with their large network at national and international level.

The new name *ADT Project Consulting GmbH* reflects in particular the increased international orientation and networking of the company, which is already active in more than 50 countries worldwide. Worldwide experience with different production systems and value chains, both for small farmers and specialized large enterprises under a variety of economic, ecological and social conditions, makes us today a worldwide competence partner in the development of a modern, competitive and sustainable agricultural and food sector.

Our area of competence has become deeper and broader step by step. New projects aiming to improve food safety or the organization of plant breeding and agricultural training underline this development process. High quality standards in the execution, support and management of a project form an important principle of our work.

Our core competences

- Specialist know-how and worldwide experience in animal husbandry and crop production systems
- Know-how regarding agricultural value chains development
- Development of rural self-help and service organizations, training centers and advisory services
- Qualification in the agricultural and food sector
- Network of international experts, professional associations and institutions
- Highly committed employees

Experience in technical cooperation in more than 50 countries worldwide

Animal welfare – a topic with growing importance for international consulting work?

In the past animal welfare was a topic mainly reserved for specialists that tended to be confined to the national context. In recent years, however, the topic has gained greater recognition and has found its way into international projects. Animal welfare and its application in agricultural practice is now increasingly relevant to consumers in developing and emerging countries and thus becoming an important building block in our project cooperation. Animal welfare concerns can play a role in, for example:

- Advice on animal husbandry, animal health, animal welfare and animal transport
- Advice and knowledge transfer on the basic needs of livestock and their implementation in agricultural production systems
- Consultation and planning of livestock housing systems taking into account animal welfare requirements and indicators

- Qualification of specialists and consultants in the professional handling of farm animals

We expect both clients and project partners to focus more intensely on this topic in our project work. As a specialist consultancy, we at ADT communicate intensively with the relevant institutions in Germany and Europe on this topic and strive for a professional and appropriate implementation and application in our technical cooperation projects.

Current project topics

Milk value chain

Milk production in Africa still has great potential for added value, regular income and jobs in rural areas. Our focus is to support actors and partners in the milk value chain in their development by providing appropriate advice and training taking into account the relevant economic, social, agro-ecological and climate conditions.

Plant breeding

India's population is increasing rapidly, and the availability of new plant varieties with properties such as improved yield, resistance to plant pests and diseases, and adaptability to changing climatic conditions is essential to sustaining the food supply there. We contribute to the exchange of knowledge and information as well as initiating and accompanying bilateral and multilateral cooperation between the relevant specialist institutions.

Vocational training in the agricultural and food sector

Vocational training projects in Ukraine and the development of training and demonstration centers in Kazakhstan and Morocco target a wide range of actors in the agri-food and rural sectors and are tailor-made for target groups.

Systems of traceability, animal health and food safety

are currently being improved or introduced in Moldova, Ethiopia and Suriname. Our task is to take the legal, technical and organizational requirements into account and, using a well-structured planning and preparation process, to put them into practice as a system.
